

Plastic splint for up to 10 days after surgery, then a pneumatic shoe.

From the 14th day:

gradual full weight bearing (in a shoe), reaching the pain barrier is possible  
delicate movements of the dorsal and plantar flexion.

**FORBIDDEN** up to 6 weeks:

plantar flexion - foot down - more than 20 degrees

lateral foot movements (especially like those in spraining).

From the 6th week:

- ordinary stabilizer - gradual change for 14 days

- training cycle whilst in a stabilizer or an orbitec (within pain tolerance).

8th-10th weeks - gradually introduce trotting and running.

From the 12th week, if everything is ok., running around the eight shaped tract, gradually decreasing its size.
